

Displaying a recommendation strategy selector

When creating the [template](#) for a [recommendation](#), you can define a **recommendation strategy selector** as a content option. The selector lists all the [strategies](#) available on the site and allows the user to select one strategy for a modification variation.

The following figure shows an example of a recommendation strategy selector in the content options UI of a variation.

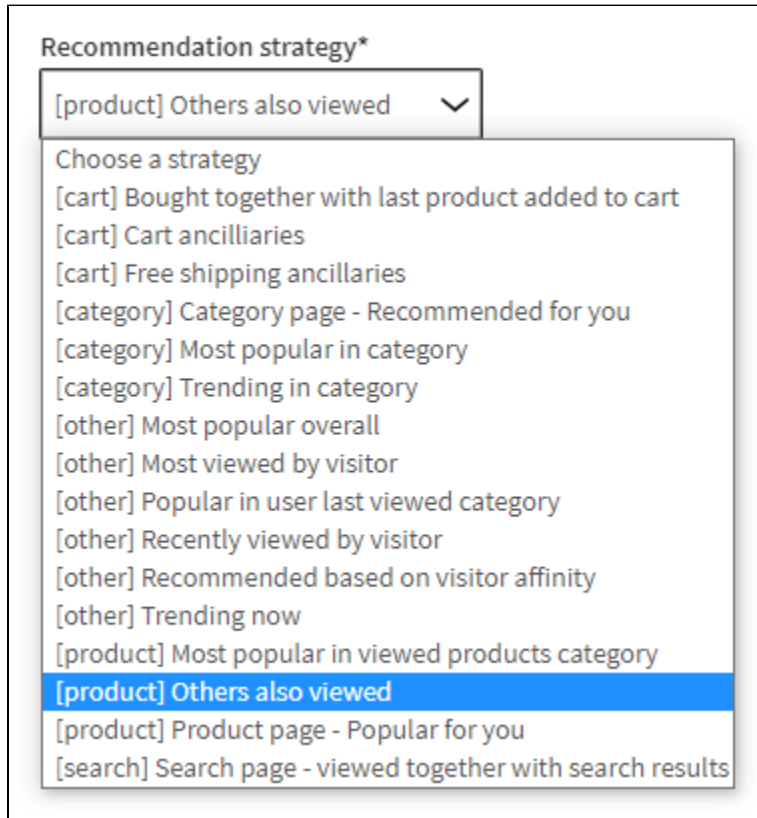

Figure: Content options UI with a recommendation strategy selector

To display a recommendation strategy selector:

1. In the template content options schema, define a content option for the selector. For example:

```
{
  "properties": {
    "strategy": {
      "type": "string",
      "title": "Select recommendation strategy"
    }
  }
}
```

2. In the template content options UI schema, set the selector to be rendered as a `RecommendationStrategySelector` widget.

```
{
  "strategy": {
    "ui:field": "RecommendationStrategySelector"
  }
}
```

When you select the template for a modification variation, the content options UI of the variation will display a recommendation strategy selector.

For more information about defining a content options UI, see the content options schema and content options UI schema documentation in [Creating and editing a template](#).
