FProxy

This document introduces the FProxy tool, and shows you how to use it to develop and test modification content locally on your computer, outside the Frosmo Control Panel.

- Introduction to modification development
- Installing and uninstalling FProxy
- Configuring FProxy
- Developing with FProxy
- Troubleshooting FProxy
- FProxy CLI commands and parameters

If you're impatient and just want to get started working on an example modification, see Example: Creating a simple site banner with FProxy. (You'll still need to perform the necessary installations, though.)

FProxy version

The latest available FProxy version is:

4.12.0

To install the latest version, or to check and update your currently installed version, see Installing and uninstalling FProxy.
