

Working with recommendation configurations (Frosmo Control Panel)

To create and use a [recommendation configuration](#) in the Frosmo Control Panel:

1. [Create the recommendation configuration](#).
2. Test the recommendation configuration by [viewing the generated recommendation data](#).
3. Use the recommendation data in a modification to build and display the final recommendation. For more information, see the [recommendations user guide](#).

You can freely [edit the recommendation configuration](#) after creating it.

You can also:

- [Manually regenerate recommendation data](#).
- [Check how long it took to generate the latest recommendation data](#).
- [Remove the recommendation configuration when you no longer need it](#).

If you're creating your own Frosmo application, you can create and manage recommendation configurations with the [Graniitti API](#).
